2 Abstract

This document is intended as a description of hardware and software facilities of SCS FIM module.

3 Overview

SCS FIM module (Freedom Interface Module) is a hardware device provided with a programmable CPU and several communication interfaces used to integrate SCS Freedom wrenches with customers system, in order to control production flow and achieve tightening traceability.

It's principal characteristics are:

- CPU with customizable software
- Communication with SCS Freedom wrenches via Bluetooth or Rs232 interface Protocol
- Communication with external Host to receive commands for wrenches and send results via rs232 or Ethernet or I/O
- 2 serial ports
- Ethernet
- File system for storing application, configurations and results
- 64Kb memory to store tightening results (2000 results)
- 8 24V input lines
- 8 24V output lines

4 Communication between FIM and Wrenches

FIM can communicate with SCS wrenches by one of the following media:

- Bluetooth, using a BT to Rs232 module
- Rs232 direct, when using cabled wrenches
- 868MHz Radio

An advanced communication protocol allows FIM to control a wide range of parameters allowing to control the wrench operations in real-time and to retrieve production results.

In most cases this protocol is too complicate to be implemented by customer's application system this is the reason why FIM can be interposed between wrenches and customer's system.

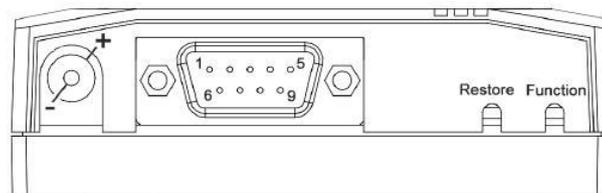

4.1 BT interface module

When using BT communicating wrenches a Bluetooth interface module must be used together with FIM. This is normally provided by SCS. Following is Bluetooth connection description

2.2.2 Power Supply

If you are not using the power adapter provided with the product or if there is none provided you must use a DC plug 2,1 mm centerpin (-) connector.

The product shall have a power supply of 5 VDC, min 200 mA on the power connector.

Picture 5. DC plug 2,1 mm centerpin (-) and 9-pin DSUB male.

2.2.3 RS232

RS232 male 9-pin DSUB:

- Pin 1: NC, not connected
- Pin 2: RD, input, receive data
- Pin 3: TD, output, transmit data

5 Communication between FIM and customer system

FIM can be interfaced to customer system in different ways, according the type of desired communication a different application firmware should be installed in SCS FIM module, see later chapter [SCS standard FIM firmwares](#)

1. 24V I/O
2. Rs232
3. Ethernet UDP messages

5.1 24V I/O

When using I/O a PLC or PC can use 24V I/O lines to:

- Select tightening programs formerly loaded to wrench using SCS SQNet windows application
- Enable/disable wrench
- Retrieve information on the status of the work cycle

6 SCS standard FIM firmwares

Two standard firmwares can be preloaded to FIM module by SCS according to the type of application

6.1 FIM generic application with 5 Input

This application allows to:

1. Manage one single wrench
2. Enable/disable the wrench via 24V I/O
3. Select tightening program or job to activate
4. Receive the tightening or job status via FIM 24V outputs
5. Receive tightening torque and angle result via RS232 or UDP messages
6. Print tightening or job report on serial Micronic Star printer or similar
7. Receive and store scanned part number string on Rs232
8. Enable wrench after scan or print (when no I/O are used for enabling)
9. Save up to 2000 result to be uploaded to SCS SQNet software

6.1.1 Rs232/UDP result telegram format:

```

1      5      10     15     20     25     30     35     40     45
$026.40 000.00 0 0 1 01-Convergenza Posterior
%$079.20 013.30 1 0 1 01-Convergenza Posterior
%

```

Torque Angle OK=1;KO=0 JobOK=1 BatchOk=1 Program description

6.2 Software functions configuration

Programmable I/O function and function enabling (print, scan...) can be made via a ini file (FimCfg.txt) to be copied into FIM file system during installation.

6.2.1 Configuration file example

See comments in red in following ini file sample for configurations short description:

```

;--- SystemName (name for BT server)
SYSTEMNAME=STATION_01

;--- 2 = After scan 4...
; Set to 2 for Fiat Termini
ENABLEEVENT=2

```

6.2.2 Installing application executable and configuration files

SCS FIM module is provided with an FTP server.

A standard FTP client application for windows such as FTPcommander can be used to copy executable files and FIMCfg.txt file to the module file system. Access to the FTP server using following username and password

Username : ftp

Password: ftp

6.2.3 Viewing FIM application debug output

Applications running on FIM applications normally output debug and information messages on the video standard output, since no display is normally connected to FIM it is possible to display those messages on a PC using a remote console application such as telnet.

This is particularly useful to understand if the system is working properly.

To do this follow this procedure:

1. Connect a crossed ethernet cable between PC and FIM RJ45 connector
2. Set PC IP to an IP compatible with FIM's IP (ex.: FIM IP= 192.168.10.200, PC IP= 192.168.10.201)
3. Start windows command prompt on PC (cmd.exe)
4. Type telnet FIM IP on DOS shell of the PC (ex.: telnet 192.168.10.200)
5. Enter username tel and password tel
6. Messages similar to the ones in the following figures should be displayed

```

C:\> Prompt dei comandi

C:\Documents and Settings>telnet 192.168.10.200

```

Before any wrench is connected:

```

Telnet 192.168.0.2

SC13 Telnet session

Username: tel
Password: ***
User logged in
SCS FIM GEN Version 3.27
Error initializing BT module on COM1...

BT module succesfully initialized on COM1...
SCS FIM GEN Version 3.27
0
48@

```

When a wrench is successfully connected:

```

Telnet 192.168.0.2

6.3 FIM RS232/UDP server

This is a simple RS232 or UDP interface that using a simple ASCII protocol allows to do the following

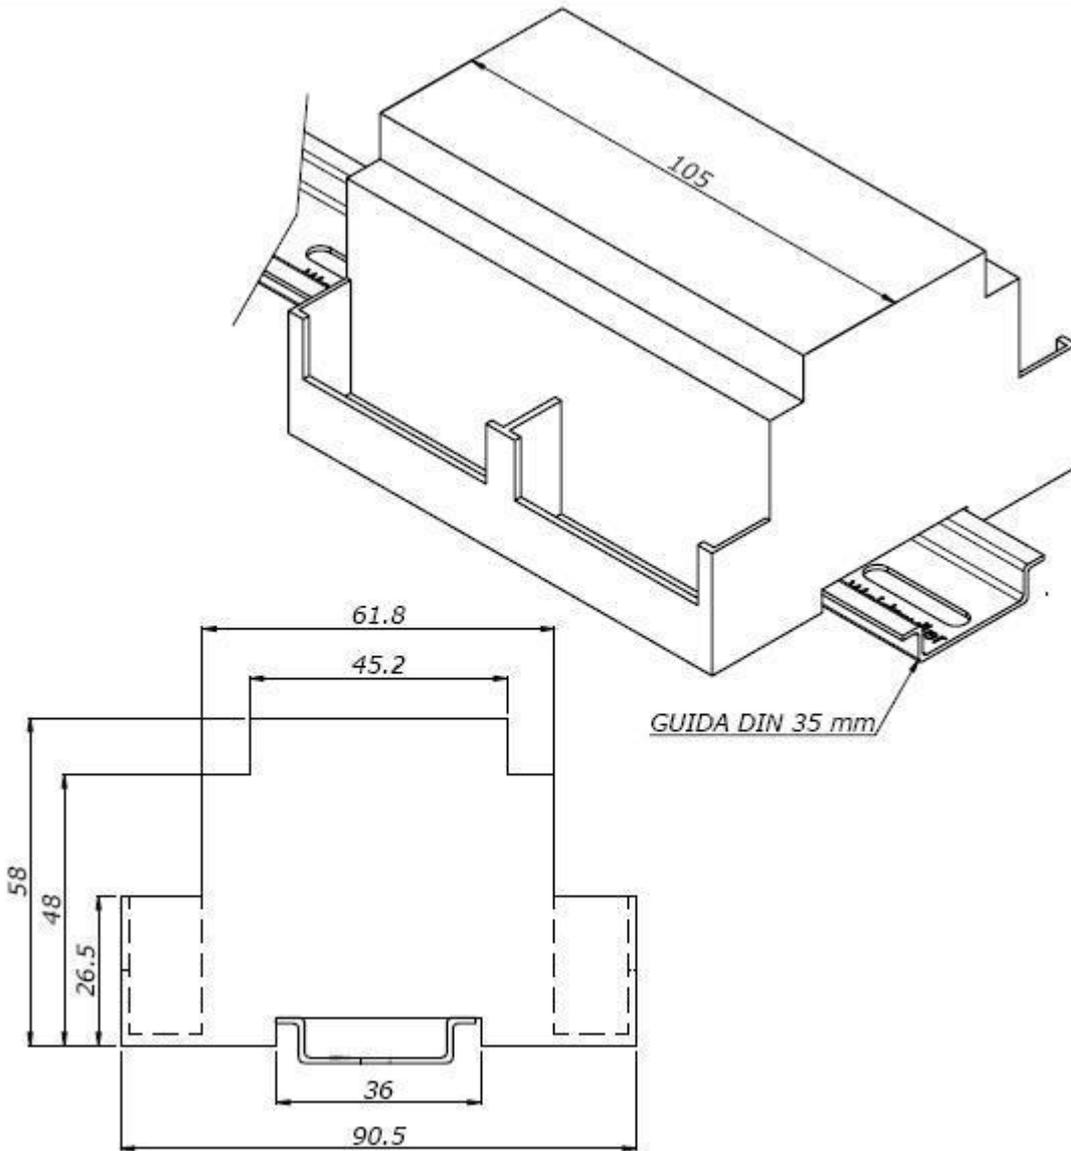

1. Enable/disable the wrench via
2. Select tightening program activate
3. Receive tightening torque and angle result

7 Installation

A typical FIM installation can be as follows:

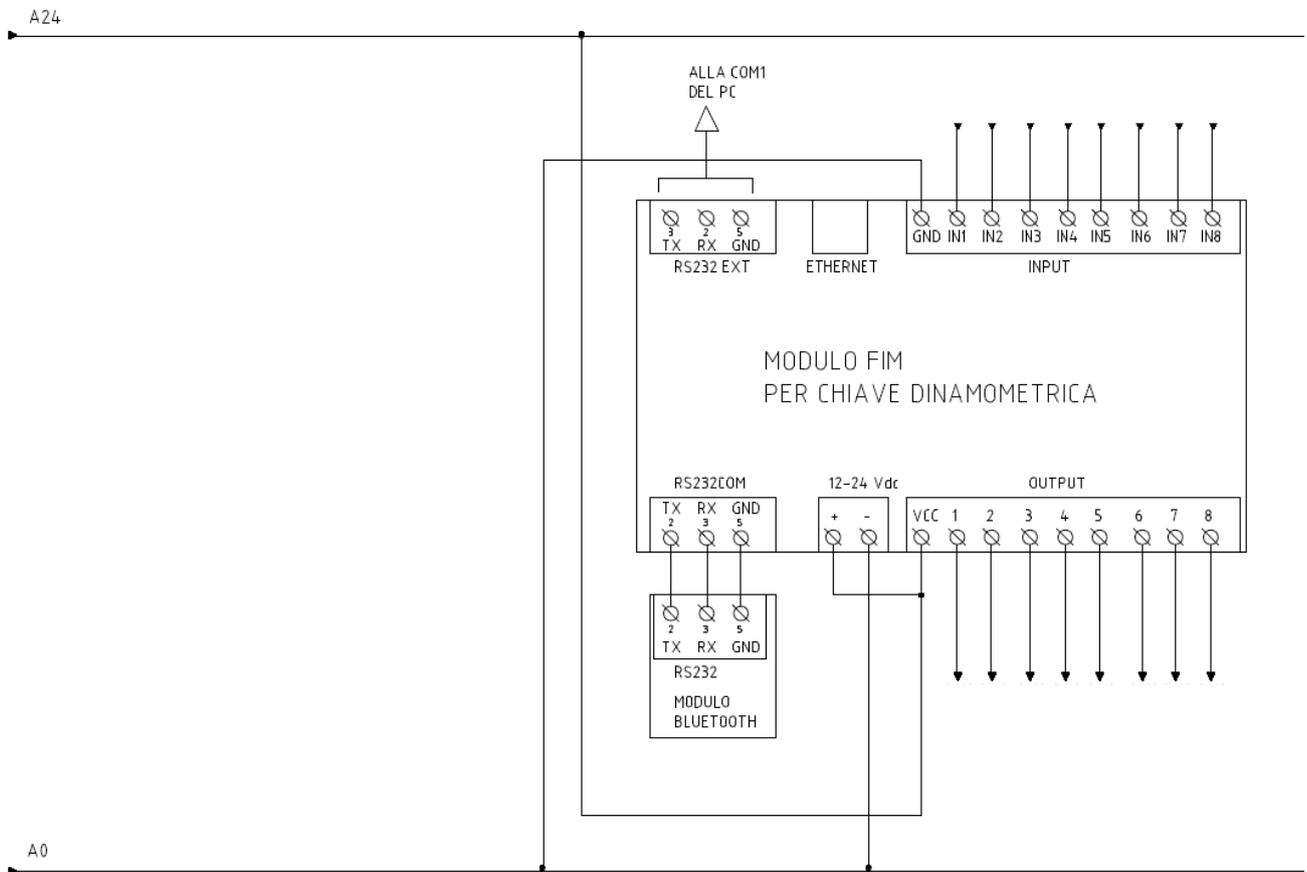

7.1 Module Dimensions

7.2 Connections

The following schema shows FIM modules connections

7.2.1 Inputs:

IN1	IN2	IN3	IN4	IN5	IN6	IN7	IN8	Function
Program Selection					Ena ble	Gen. purpose		
0	0	0	0	0				No program or job selected
1	0	0	0	0				Program or job 1 selected
0	1	0	0	0				Program or job 2 selected
1	1	0	0	0				Program or job 3 selected
1	1	1	1	1				Program or job 32 selected
x	x	x	x	x	0			If FIM is configured to use enable bit the wrench stay disabled even if a program is selected
x	x	x	x	x	1			If FIM is configured to use enable bit, the wrench is enabled

7.2.2 Outputs

O1	O2	O3	O4	O5	O6	O7	O8
Bit 1-3 of selected program			Wrench ready	Latest test OK	Latest test KO	JOB complete	BATCH complete

7.2.3 Serial cable to host

Connection to external host system is a typical NULL modem connection where Tx and Rx wires must be crossed:
