Disassembly and Reassembly of the Pulse Unit

ALPHA-T42 – T62 and UBP-7 & T7

A. Disassembly of Pulse Unit

1. Remove the front casing from the tool. This is a left-hand thread on all but the UBP-7 and UBP-T7.
2. Turn the Torque Adjuster in until it stops. On the UBP-7 and T7, turn the Accumulator counter-clockwise until it stops.
Note: This is a left-hand thread. Remove the Hexagon Round Head Plug inside the Rear Liner Plate on the UBP-T7.
3. Remove the Oil Fill Plug and vacuum the oil out of the Pulse Unit with the VCE-1-1 Vacuum Extractor.
4. Set the Liner Casing Setter, located at the rear of the Pulse Unit, onto the correct size pins in the blocks of the setter. **Note:** This is left-hand thread.
5. Place the Pulse Unit assembly onto the correct size base plate and between the clamp plates of the PTRF-1-1. Run the press rod down into the setter and secure it with the lock nut; it is not necessary to put any pressure on the press rod. Tighten the clamp screws securing the Pulse Unit.
6. Set a 1/2" breaker bar into the setter; this is a left-hand thread indicated by an arrow on the Liner Casing Setter.
7. Loosen and remove the Liner Casing Setter. Remove the Pulse Unit from the repair fixture.
8. Remove the Rear Liner Plate.
 - a) If suction is too great, tap the drive end of the Anvil on bench and loosen Rear Liner Plate.
 - b) Remove the two locator pins from the rear of the Liner.
 - c) Remove the Accumulator and Spacer from the Rear Liner Plate. On the ALPHA-T42 through T62, remove the Spring Washer. On the UBP-7 and T7, unthread the Accumulator clockwise. **Note:** This is a left-hand thread.
 - d) Remove the Torque Adjuster, Spring, and Ball from the Rear Liner Plate.
 - e) Remove the Relief Valve and Pin from the Rear Liner Plate.
 - f) Remove the Snap Ring, Spacer, O-Ring, and Piston from the rear of the Rear Liner Plate. On the UBP-7, remove the Polyurethane Rubber in the Rear Liner Plate.

Disassembly and Reassembly of the Pulse Unit

9. Rotate the Anvil until the bevel lines of the Anvil are parallel with the contacting lines inside the Liner. Push the Anvil and Driving Blades out of the Liner.
10. Remove the Front Liner Plate and Liner from the Liner Casing. **Note:** You may have to tap the rear of the Liner Casing on the bench to remove the Front Liner Plate.
11. Remove the two Locator Pins in the front of the Liner.
12. Remove all O-rings and Supporter Rings from the parts. Remove the Anvil, O-ring or Teflon seal and Supporter ring located inside the Liner Casing.

B. Inspection

1. Front Liner Plate

- a) If light scarring on plate surface is present, resurface on Lap Plate in a figure eight motion with 220 grit sandpaper (wet or dry) using honing oil as a buffer. **Note:** All markings must be removed.
- b) If heavy scars or burring are present and cannot be resurfaced smooth, replace parts as needed.

2. Rear Liner Plate

- a) Do not resurface. There will be a seating mark from the Anvil, and when this gets deeper than .05 mm in depth, replace the part.
- b) The Spacer for the Piston should not be larger than 5mm in inside diameter.

3. Liner Casing Setter

- a) Wire wheel outer threads to remove old Loc-Tite.
- b) Resurface bottom setting surface (level) using Lap Plate and 220 grit sandpaper.

4. Driving Blades

- a) Check the contour surface of the blades for scars or burring.
- b) If driving blade is scarred below the contour surface, fluid will pass underneath the blade at contact points, resulting in inaccurate pressure in the Liner and low torque output.
- c) If there is heavy scarring (cuts below contour surface) replace it.

Disassembly and Reassembly of the Pulse Unit

- d) Light scarring on contour surface is normal wear. Clean surface on Lap Plate by lapping the length of the blade and roll with the contour.
 - e) Light horizontal grooves on side of blade is normal wear.
 - f) Check plate ends of the blade for grooving. If heavy grooving is present, always replace the blades as a set.
5. **Liner**
- a) Inspect inner horizontal and vertical blade seats for scars and burring.
 - Light scarring is normal wear.
 - Heavy scars will cause the fluid to pass by the driving blade, and the Liner will not produce accurate pressure for torque output. Replace.
6. **Torque Adjuster/Relief Valve**
- a) Check the Adjuster for straightness; also check Allen end for cracking, damaged, or stripped threads. If damage is present, replace.
 - b) Check Ball seat for oblonging.
7. **Liner Casing**
- a) Check for internal scars and burring.
 - b) Check internal threads for burrs.
8. **Anvil**
- a) Check plate surface of Anvil. If light scarring or uneven wear is present, resurface with medium oil stone using honing oil as a buffer.
 - b) If heavy scarring is present and cannot be resurfaced smooth, replace Anvil.
 - c) If chips or cracking are present, replace Anvil.
 - d) If uneven wear from socket is present, replace Anvil.
 - e) Check Anvil at contact point with O-ring or Teflon Seal. If there is an indentation present on the Anvil at this point, the Anvil should be replaced.
 - f) Check the Anvil for scarring from Anvil bushing. If heavy scarring is present, replace Anvil.
9. **Thoroughly clean all parts and blow dry.**
10. **Replace all O-rings, Springs, and Supporter Rings.** This can be easily done by purchasing a Pulse Unit Repair Kit.

Disassembly and Reassembly of the Pulse Unit

C. Reassembly

1. Using a blow gun, clean parts of any remaining solvent or lint.
2. Install O-rings onto the Torque Adjuster, Relief Valve, and Oil Fill Screw.
3. Install the O-ring, Spacer, and Snap Ring into the rear of the Rear Liner Plate. Install the Relief Valve and Pin into the Rear Liner Plate. Install the Ball, Spring, and Torque Adjuster into the Relief Valve in the Rear Liner Plate. **Note:** Turn the Torque Adjuster all the way in a clockwise direction.
- a) On the UBP-7 and T7, thread the Accumulator onto the Rear Liner Plate counter-clockwise until it stops. **Note:** This is a left-hand thread.
- b) Set the Rear Liner Plate onto a 6mm Allen Wrench. Install the two short Locating Pins and the Liner. **Note:** The Liner has no top or bottom.
4. Install Driving Blades and Springs into Anvil. Place in Driving Blade Setter.
5. Install Anvil and Driving Blades into Liner.
6. Install the two long Locating Pins into the Liner and install the Front Liner Plate. On the UBP-7 and T7, install the Anvil Rear Spacer first and the Anvil O-ring into the Front Liner Plate.
7. Install Rear Plate O-ring.
8. Install the Anvil Sleeve for the Anvil O-ring; this is not needed on the UBP-7 and T7. **Note:** There is an Anvil Sleeve for the 1/4" hex Anvil and the 3/8" square Anvil.
9. Install the Teflon Seal into the front of the Front Liner Plate; this is not used on the UBP-7 and T7.
10. Install the Liner Casing and make sure you line up the holes in the Liner Casing with the Oil Fill Screw hole and Torque Adjuster hole in the side of the Liner Casing.
11. Install the O-ring onto the Accumulator Spacer and install into the rear of the Liner Casing and over the Rear Liner Plate, O-ring first. Install the Spring Washer on the ALPHA-T42 through T62 over the Rear Liner Plate. Install the O-rings onto and into the Accumulator and install into the rear of the Liner Casing and over the Rear Liner Plate, O-ring side first. **Note:** The Accumulator threads

Disassembly and Reassembly of the Pulse Unit

- into the Rear Liner Plate on the UBP-T7.
- Clean all oils from the threads of the Liner Setter and Liner Casing. Lightly coat the threads with a good cleaner/degreaser. Put a light coat of a good quality thread locker on the threads of the Liner setter and thread it into the Liner Casing.
 - Set the Liner Casing Setter, located at the rear of the Pulse Unit, onto the correct size pins in the blocks of the setter. **Note:** This is a left-hand thread.
 - Place Pulse Unit assembly onto the correct size base plate and between the clamp plates of the PTRF-1-1. Run the press rod down into the setter and secure it with the lock nut. It is not necessary to put any pressure on the press rod. Tighten the clamp screws securing the Pulse Unit.
 - Set a 1/2" torque wrench into the Setter and tighten the Liner Setter to the recommended torque shown on the chart.
 - Remove the Pulse Unit from the repair fixture.

D. Fluid

- Recommended fluid is AIM/Uryu Pulse Unit Fluid, part number SPF-OIL.

E. Filling Procedure

- Turn the Torque Adjuster out counter-clockwise until it stops. Turn the Accumulator out clockwise until it stops on the UBP-7 and T7.
- The Pulse Unit is now set for maximum fill. Any measurable change in fluid level will affect the torque output and the consistency of the tool.
- Put the Pulse Unit in the Vacuum Tank, Anvil-side down, with the rear of the Pulse Unit up to purge all air out of the Pulse Unit.
- Follow the fill procedures as outlined in the Operations Manual for the VC-101-2 Vacuum Tank.
- Before removing the Pulse Unit from the Vacuum Tank, install the Piston and make sure the Accumulator is all the way out while the Pulse Unit is under

Disassembly and Reassembly of the Pulse Unit

the Oil. Install the Polyurethane Rubber and Hexagon Round Head Plug on the UBP-7.

6. Putting your thumb over the Oil Fill hole, remove the Pulse Unit out of the Vacuum Tank and set it on its side into the Fixture to press the Accumulator.
7. Press the Accumulator in and install the Oil Fill Plug. On the UBP-7 and T7, turn the Accumulator counter-clockwise until it

stops. Install the Oil Plug and turn the Accumulator out clockwise until it stops.

8. You are now ready to test the Pulse Unit. **Note:** If the Unit does not come up to torque, put it back into the Accumulator Jig and depress the Accumulator. Remove the Oil Fill Plug and rotate the Anvil until a few drops of oil come out. Install the Oil Fill Plug and test again.

F. Torque Adjustment

1. To properly adjust the torque, turn the Adjuster with a 2mm Allen wrench clockwise until the Adjuster Valve bottoms-out for maximum torque.
2. Reverse procedure for minimum torque.

Recommended Maintenance

Pulse Unit

The Pulse Unit Oil should be changed every 150,000 cycles and the Pulse Unit should be rebuilt and a repair kit installed every 300,000 cycles. Remember to always use genuine Uryu Parts and SPF-Oil Pulse Unit Fluid.
